TVZ VAV Terminal Box

Trox VARYCONTROL VAV terminal boxes type TVZ - TVA provide volume control for variable air volume systems, for both supply and extract air. The box consists of a casing with circular high pressure duct connection and rectangular low pressure duct connection, integral acoustic silencer, averaging differential pressure grid for volume flow measurement control damper with actuator and control components. The control system can be pneumatic or

TVZD VAV Terminal Box

electronic. Each VAV box is tested and the desired volume flow rates set in the factory. The control damper with plastic elastomer seal has a closed leakage complying with DIN 1946, Part 4. For additional acoustic performance a TS secondary silencer is available, additionally acoustic cladding on the casing can be supplied. TVZ boxes are available with one to four row reheat coils.

# Construction • Dimensions

## Design features

### Casing

- Circular spigot connection on high pressure side to DIN 24145 and DIN 24146
- Low pressure side suitable for slide-on flange or angle flange connection
- Holes in the edge of the casing for support rods. Casing air leakage rate complies with class II, VDI 3803 and DIN 24194
- Conforms with clean room class 3, VDI 2083, and class 100, US standard 209b

### Volume flow control

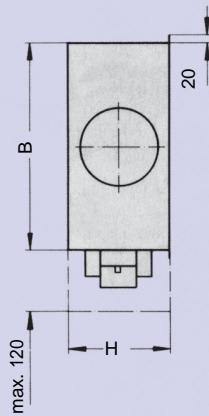

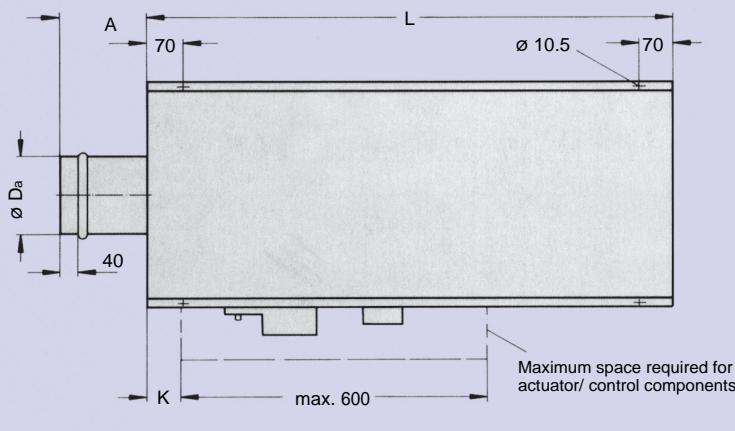

- Either pneumatic or electronic
- Suitable for supply or extract air
- Volume control range up to 10: 1, depending on the type of controller
- Set volume controlled with high level of accuracy, even under adverse upstream conditions, by means of averaging differential pressure sensor (see page 5)
- Differential pressure range 20 to 1500 Pa

- Full shut off using the control damper wiring by others
- Control damper leakage complies with DIN 1946, Part 4
- Actuated baffle plates to optimise acoustic and aerodynamic performance located behind the control damper
- Horizontal or vertical mounting (when using diaphragm pressure sensors, mount according to the labels on the box)
- Volume flow set and airflow tests conducted on each box at the factory
- Volume flow can be measured and adjusted on the box at site
- Maintenance-free
- Operating temperature range 10 to 50 °C

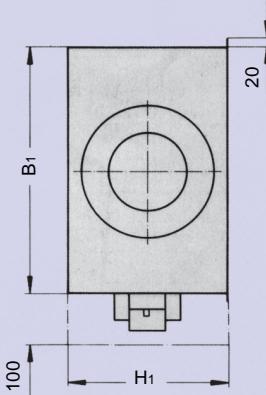

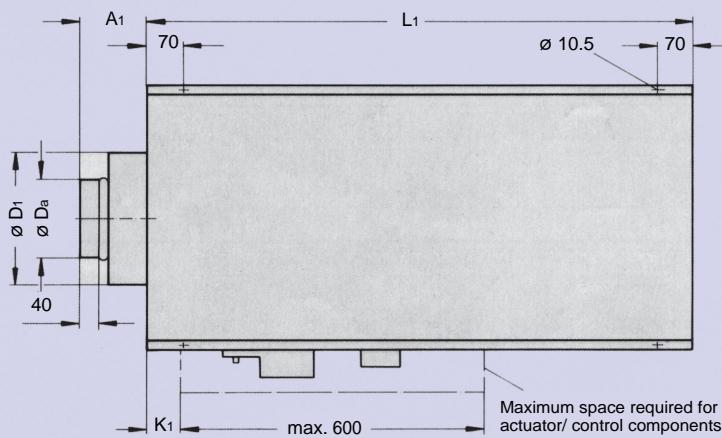

### Additional Acoustic Cladding

- Reduces the radiated noise from the casing
- Outer casing from galvanised sheet steel
- Sound absorbent lining
- Rubber isolators for insulation of structure borne noise.

## TVZ · TVA

## TVZD · TVAD

**Ensure adequate access is provided to control components**

## Reheat Coil

- For terminal reheat of primary air volume
- Casing from galvanised sheet steel
- Flanged on both ends
- Copper tubes and aluminium fins
- One or two row (three and four-row formed by combination)
- Available factory fitted or supplied separately
- For LPHW or MPHW or steam, up to 130 °C
- Maximum operating pressure 16 bar

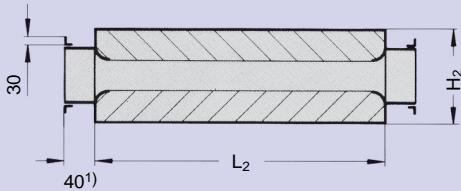

## TS Secondary Silencer

- For reduction of ductborne noise
- Casing from galvanised sheet steel
- Mineral wool lining
- With angle flange or slide-on duct flanges

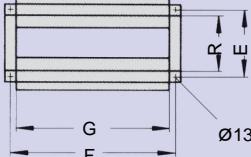

## Materials

- Casing from galvanised sheet steel
- Lining in the attenuator section and in the control damper chamber with material fire rating A2, DIN 4102
- Mineral wool with glass fibre facing in the attenuator section suitable for air velocities up to 20 m/s
- Control damper from galvanised sheet steel with thermoplastic elastomer seal
- Sensor hub in plastic
- Sensor tubes in aluminium
- Plain bearings in polyurethane

### TS secondary silencer

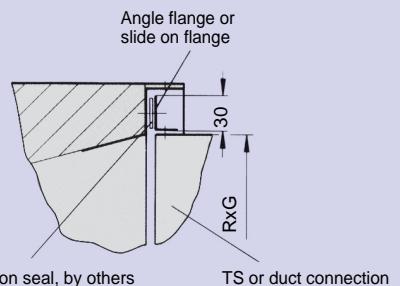

Rectangular duct connection

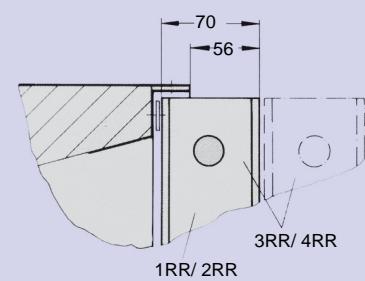

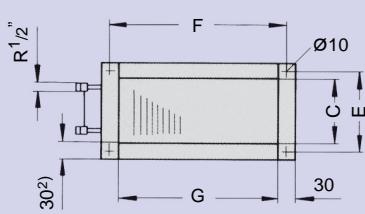

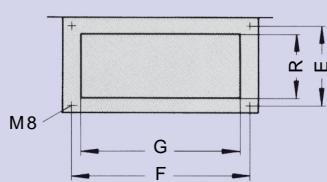

Reheat coil 3)

### TS or duct connection

Reheat coil connection

Three and four-row heaters have 2 inlet and 2 return water connections. Joining of these connections by others

# Air Volume Control • Entry Flow Conditions

## Air volume control for the example of a supply box with combined extract box

The room temperature controller ⑥ signals the velocity controller ⑦ on the supply box and adjusts its set point between the minimum and maximum volume values set at the factory, as a function of the room temperature. The differential pressure  $\Delta p_w$  measured at the differential pressure grid ① is transmitted via the supply air transducer ③ to the velocity controller ⑦. This signal is compared with the set point value. If there is any variance, the control damper ② is adjusted accordingly via the actuator ⑤, so that the air volume is held constant within a small tolerance over the entire static differential pressure range. To control the extract air volume, the output signal from the supply air transducer ③ is connected to the extract air velocity controller ⑧. This ensures that the extract air volume follows changes in the supply air volume. Ratio or differential extract volume control can be used, depending on the type of controller used.

- |                              |  |

# Nomenclature • Volume Flow Range

## Nomenclature

$f_m$	in Hz: Octave centre frequency
$L_w$	in dB/Oct.: Air regenerated noise: Sound power level from low pressure side measured in a reverberation chamber (re 1 pW)
$L_{WR}$	in dB/Oct.: Air regenerated noise: Sound power level in the high pressure duct (re 1 pW)
$L_{WRA}$	in dB(A): A-weighting of $L_{WR}$
$L_pA$	in dB(A): Air regenerated noise: A-weighting of sound pressure level including 8 dB room attenuation
NC	: Noise criteria including room attenuation of 8 dB/Oct.
NC <sub>1</sub>	: Noise criteria rating of $L_{WR}$
D <sub>E</sub>	in dB/Oct.: Insertion loss

$\Delta p_{st}$	in Pa: Static pressure differential
$\Delta p_{st\ min}$	in Pa: Minimum static pressure differential
$\Delta p_w$	in Pa: Differential pressure across the differential pressure grid
$\dot{V}$	in l/s or in m <sup>3</sup> /h: Volume flow
$\dot{V}_P$	in l/s or in m <sup>3</sup> /h: Volume flow range with pneumatic controller
$\dot{V}_E$	in l/s or m <sup>3</sup> /h: Volume flow range with electronic controller
$\Delta \dot{V}$	in ± %: Volume flow tolerances on volume set value
$\Delta \dot{V}_{min}$	in l/s or m <sup>3</sup> /h: Minimum difference between minimum and maximum volume settings (not applicable to Trox-DDC and Honeywell. For Belimo and Johnson Controls 20 % of maximum design value)
$\Delta L$	in dB or NC: Correction values for TVZ with reheat coil

## Diagrammatic layout of the test laboratory

I. Determination of the case radiated sound power level

II. Determination of the insertion loss difference in the sound level measured when substituting straight piece of duct for box

III. Determination of the ductborne regenerated sound power level

**Table 5**

# TVZ Air Regenerated Noise with Reheat Coil without TS

## Example

Data given: TVZ size 16 with reheat coil 3 RR

$$\dot{V} = 65 \text{ to } 250 \text{ l/s or } 234 \text{ to } 900 \text{ m}^3/\text{hr}$$

$$\Delta P_{st} = 500 \text{ Pa}$$

$$\Delta L = 3 \text{ dB}$$

Specified sound pressure level in the room

50 dB (A) with 8 dB/oct. room attenuation

Required: Regenerated noise in the room as dB (A) value  
at  $\dot{V} = 250 \text{ l/s or } 900 \text{ m}^3/\text{hr}$

Calculation:  $L_{pA} = 44 \text{ dB (A)} + 3 \text{ dB} = 47 \text{ dB(A)}$ ,  
specification is met

# TVZ Case Radiated Noise

## Example

Data given: TVZ size 20

$\dot{V} = 100 \text{ to } 278 \text{ l/s or } 360 \text{ to } 1000 \text{ m}^3/\text{hr}$

$\Delta p_{st} = 500 \text{ Pa}$

Specified sound pressure level in the room  
35 dB(A) with 4 dB/oct. room attenuation and  
4 dB/oct. ceiling reduction

Required: Case radiated noise in the room using sound spectrum data where

$\dot{V} = 278 \text{ l/s or } 1000 \text{ m}^3/\text{hr}$

## Calculation (figures in dB/oct.):

$f_m$ in Hz	63	125	250	500	1000	2000	4000	8000	16000
$L_w$ (without additional acoustic cladding)	55	52	50	44	39	37	35	37	37
Ceiling noise reduction	4	4	4	4	4	4	4	4	4
Room attenuation	4	4	4	4	4	4	4	4	4
A-W weighting*	47	44	42	36	31	29	27	29	29
	-26	-16	-9	-3	0	+1	+1	-1	-1
Corrected level	21	28	33	33	31	30	28	28	28

\* see e.g. VDI 2081

Result:  $L_{PA}$  approx. 39 dB(A) according to logarithmic addition. Specification is not met. Additional acoustic cladding necessary (see page 13 for calculation).

Table 10

# TVZD Case Radiated Noise

## Example

Data given: TVZD size 20

$\dot{V}$  = 100 to 278 l/s or 360 to 1000 m<sup>3</sup>/hr

$\Delta p_{st}$  = 500 Pa

Specified sound pressure level in the room  
35 dB(A) with 4 dB/oct. room attenuation and  
4 dB/oct. ceiling reduction

Required: Case radiated noise in the room using sound spectrum data where

$\dot{V}$  = 278 l/s or 1000 m<sup>3</sup>/hr

Calculation (figures in dB/oct.):

$f_m$ in Hz	63	125	250	500	1000	2000	4000	8000
$L_w$ (with additional acoustic cladding)	53	49	43	33	25	24	20	23
Ceiling noise reduction	4	4	4	4	4	4	4	4
Room attenuation	4	4	4	4	4	4	4	4
A-W weighting*	45	41	35	25	17	16	12	15
-26	-16	-9	-3	0	+1	+1	-1	
Corrected level	19	25	26	22	17	17	13	14

\* see e.g. VDI 2081

Result:  $L_{PA}$  approx. 30 dB(A) according to logarithmic addition. Specification is met.

Table 11

# Reheat Coil Selection

## 1 Mean water pressure drop for sizes 12 to 40

## Water pressure drop calculation

One or two row reheat coil

$$\dot{m}_{wk} = \frac{\dot{m}_w}{K} \text{ in kg/s}$$

Three-row reheat coil (2 RR and 1 RR connected in parallel)<sup>1)</sup>

$$\dot{m}_{wk} \approx \frac{\dot{m}_w \cdot 0.75}{K^2} \text{ in kg/s}$$

Four-row reheat coil (2 RR and 2 RR connected in parallel)<sup>1)</sup>

$$\dot{m}_{wk} \approx \frac{\dot{m}_w \cdot 0.5}{K^2} \text{ in kg/s}$$

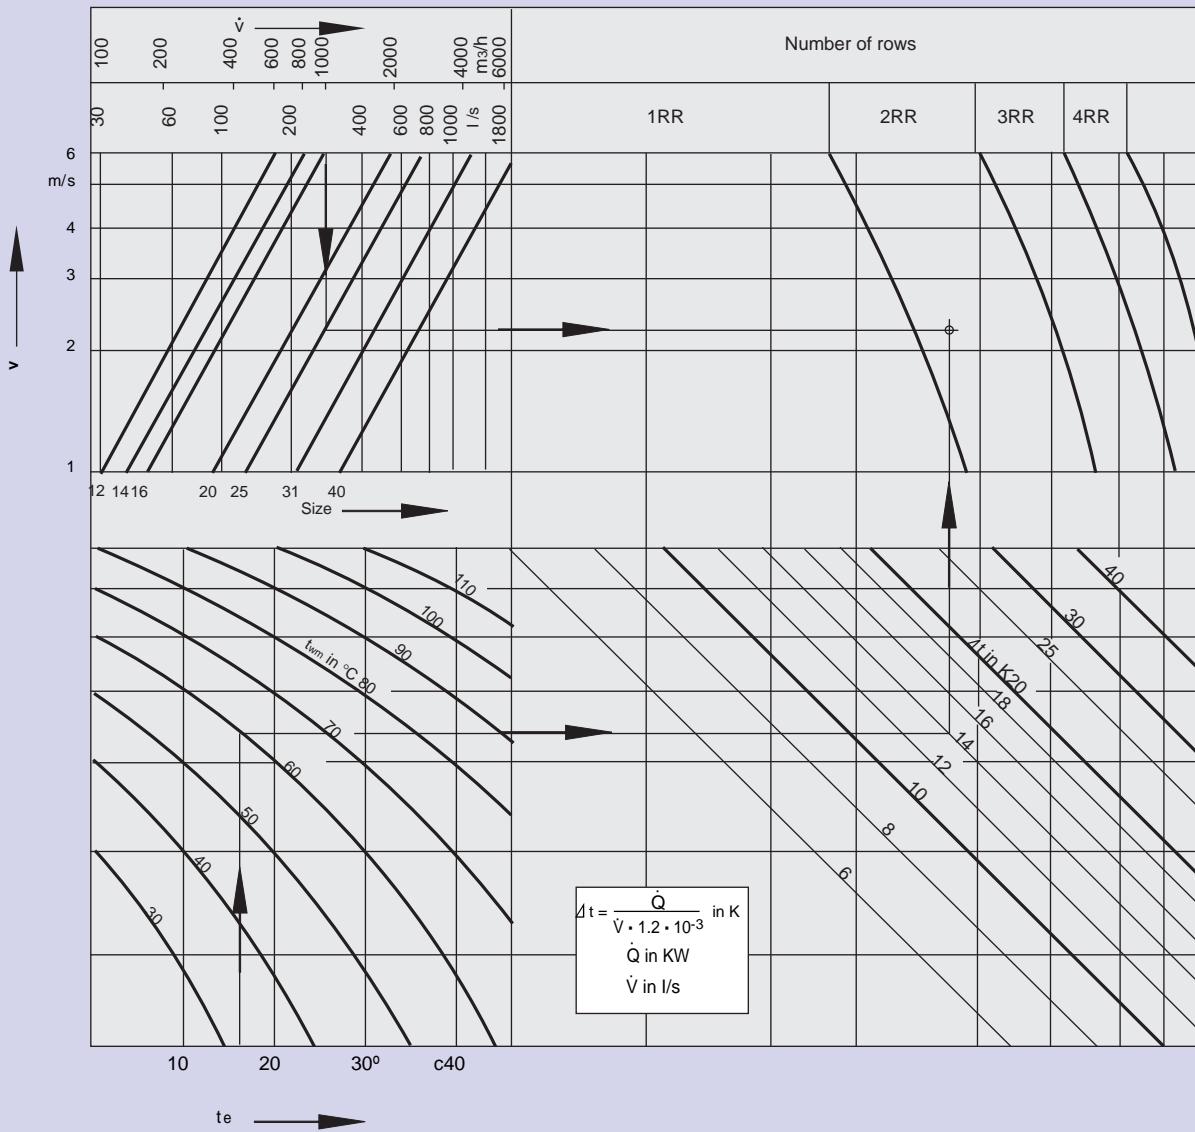

1) Flow and return connections joined by others.

2) For two row reheat coil.

## Number of circuits

Size	12	14	16	20	25	31	40
K	1 RR	1	1	1	2	2	4
	2 RR	1	1	2	4	4	7

## 2 Selection diagram

# TVZ Order Details

## Specification Text

VAV terminal box for variable volume supply air systems, flow rate range 15 to 1780 l/s or 54 to 6408 m<sup>3</sup>/hr, suitable for connecting to pneumatic or electronic control circuits. Damper leakage complies with DIN 1946, Part 4, when fully closed wiring by others. Each VAV box is tested and the desired volume flow rates set in the factory.

Sensing of the volume flow rate is by an averaging differential pressure grid. The minimum and maximum volume flow rates set at the factory are capable of being site monitored and adjusted. Actuated baffle plates are located behind the control damper to optimise acoustic and aerodynamic performance. Casing is lined with acoustic and thermal insulation, erosion-resistant up to 20 m/s. Circular high pressure duct spigot connection, low pressure duct connection angle flange or slide-on flange. Casing air leakage rate complies to class II, VDI 3803 or DIN 24194. The equipment conforms with clean room class 3, VDI 2083, and class 100 US-standard 209 b.

Static differential pressure range 20 to 1500 Pa, volume flow turndown to 10:1, depending on the type of controller.

## Materials:

Casing from galvanised sheet steel, mineral wool lining in the attenuator and damper section to have density of 30 to 40 kg/m<sup>3</sup>, with glass fibre scrim facing suitable for air speeds of up to 20 m/s, non-combustible to DIN4102, material category A2. Control damper from sheet steel with thermoplastic elastomer seal, plastic sensor hub, aluminium sensor tubes, polyurethane plain bearings.

## Available with:

Additional Acoustic Cladding.

For reduction of the radiated noise from the casing, consisting of 40 mm mineral wool and an outer casing in 1 mm galvanised sheet steel.

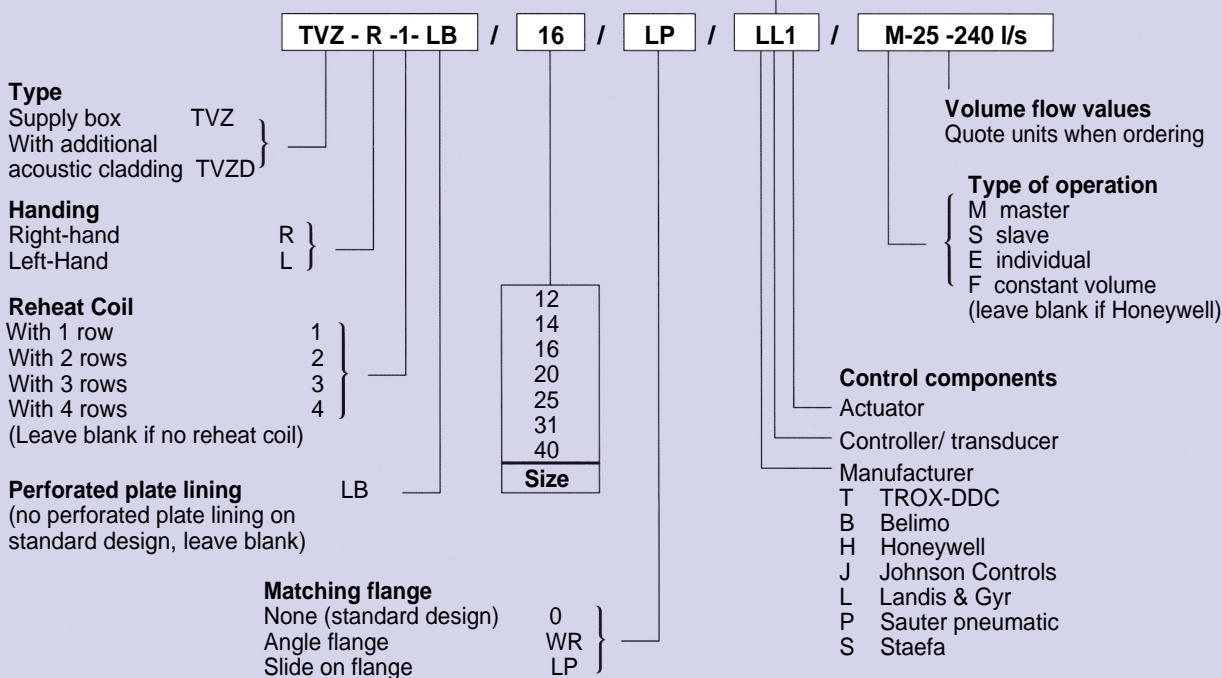

## Reheat coil

For supply volume reheat, casing from galvanised sheet steel, copper tubes and aluminium fins, connected to the box on the discharge side, flanged both ends.

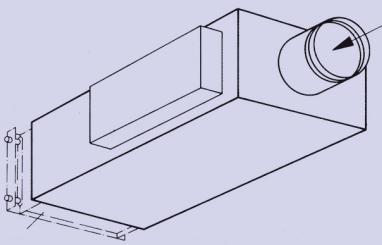

## TS Secondary Silencer

For reducing the discharge noise from the box, mineral wool lining and casing in 1 mm galvanised sheet steel, with angle flange or slide on flanges connections both ends.
